Free Telephony Project 1

- many people working in open software
 - we are working in open hardware
 - designs can be copied modified, re-used without restriction
 - we encourage cloning of our products
-

Free Telephony Project 2

- trend: functionality shifting from hardware to (free) software
 - trend: total system costs constantly dropping
 - falling costs are a good thing for the developing world
 - leverage trends using free hardware designs
-

Why Free Telephony Project?

- Hardware designs are free as in speech
 - Use FOSS and Open Hardware to drive system costs down
 - Lower the cost of telephony for everyone on the planet
 - A phone call should be a human right, not a privilege
-

Open Hardware

- normal hardware costs include 70% overhead
 - exciting new business models, e.g. OLPC
 - dramatic price reductions
 - local manufacture
 - customisation, localisation, e.g. solar, wireless
-

Asterisk Hardware 1

Asterisk Hardware 2

TDM400P Wildcard, 1FXO +1 FXS

IP04 IP-PBX

Case Study - IP04

- Switches analog and VoIP calls
 - fanless, low power (3W), rugged, compact
 - open hardware and software
 - easy to customise, e.g. simple UI
 - potential for very low cost
-

Case Study – IP04

VoIP and GSM

- VoIP can extend GSM/PSTN network at edges, revenue for incumbent telcos.
 - IP04 plus WiFi backhauls costs are 5% of GSM deployment (base station)
 - free, untimed, community owned networks
 - or local business models
-

VoIP in a Box

- How easy can we make VoIP over Wifi?
 - First Pass – preconfigure Ubiquity NS2 and IP04
 - Test on my Kids! Five minutes training
-

Deploying VoIP – Six Challenges

- Power
 - Quality (of Service)
 - Upstream connectivity
 - Network management
 - Business models
 - Marketing
-

Deploying VoIP – Six Challenges

Power

- Infrastructure = Power
 - Infrastructure needs access to power
 - More power with less power
-

Power

Power

Power

Quality of service

- It takes 10% of the time to make Internet to work, and 90% of the time to make it work efficiently
 - Networks are not designed to differentiate between types of traffic
-

Quality of service

Upstream connectivity

- VoIP call requires 20-30 Kbps dedicated bandwidth
 - 0.05 USD / month – local bandwidth
 - 50 USD / month – international bandwidth (VSAT)
 - 5 USD / month – ADSL (fiber)
-

Upstream connectivity

- 1/100 scale economy
 - Local services are key
 - Local content is key
 - Build low power, high capacity backhauled
-

Network management

- Challenge of moving from small to medium – large scale networks
 - 1 person = 4 customers
 - 1 person = 150 customers
-

Business model

- What is profit?
 - What is growth?
 - Is there a business model?
 - What is development?
-

xxx model

- Development is the possibility to “choose”
 - Need to understand and measure cost/outcome
-

Marketing

- Marketing strategies
 - Low cost
 - Identity
-

Marketing

- Make business local
 - Make <model> local
 - Market-ing vs Community-ing
-

Voice Potato Bag

- Power – Low power
 - Quality (of Service) – Traffic management
 - Upstream connectivity – Local services
 - Network management – Visualize your network
 - Business models – Design & Evaluate
-
- Marketing – Make noise!
